

# SCRIPTING LANGUAGE

## Unit-1 CLIENT SIDE SCRIPTING

Needs of Client Side Scripting Language

Formatting and coding conventions in JavaScript

Array and For Each Loop

Defining and Invoking Functions

JavaScript Built in Object (Boolean & Number Objects, string, Date, Array, Math, RegExp Object)

Date Object

Interacting with Browser (Window Object, Navigator Object, History Object, Screen Object, Location Object)

Windows and Frames

Document Object Model (DOM Properties)

Event Handling

Form Validation with JavaScript

Cookies ,Its type and implementation

Handling Regular Expression

Client Side Validation Using JavaScript

## Possible Questions

1. What is JavaScript? Explain the important features of JavaScript.
2. Write JavaScript to print the largest and smallest number among 20 elements of an array.
3. Write JavaScript to sort 10 elements of an array either ascending or descending order?
4. Difference between server side and client side scripting language.
5. Describe JavaScript coding convention with example.
6. What is exception handling? Describe the exception handling in JavaScript.
7. Describe use of For Each loop in JavaScript.
8. What is NaN in JavaScript? Write JavaScript code to change background color of web page every second.
9. What is JavaScript? Compare JavaScript with Object Oriented Programming like Java.

10. Write a client side program to display the continuous Time in the status bar of the browser. Time should be updated every second.
11. Write a program which includes a function add (). It should take arbitrary number of parameters and return the result by adding all the parameters. Use browser message box to display the output.
12. What is document object model? Describe DOM tree with example?
13. Describe different DOM properties and methods with example.
14. Different between event and event handler in JavaScript.
15. Describe how event handler works in JavaScript.
16. Describe how we can access web form objects in JavaScript with example.
17. Difference between client side and server side form validation.
18. Describe different JavaScript method and properties associated into form validation.
19. What is regular expression? Describe quantifiers and meta character with example.
20. Write JavaScript to validate form with the help of following criteria.
  - ❖ Name is required and must be 8 character
  - ❖ Password and confirm password is required and should match
  - ❖ Phone number is required and must be number with 10 digits
  - ❖ Email is required and must be email format
  - ❖ DOB is required with format of year (4 digit), month (2 digit) and day (2 digit)
  - ❖ Country is required
  - ❖ Gender must be selected
  - ❖ Should accept term and condition to submit form.
